

ANSWER THE CALL TO “SEND VIA DIRECT!”

Why is healthcare the last remaining industry that’s still using fax?

NOW DIRECT-READY!

THE CHANGE IS SIMPLE

With **DirectSecureMessaging** service powered by EMR Direct, you're ready to exchange structured data with over 2.5 million trusted network endpoints in referrals, event notifications and more. Send from or receive within MDVita in a standard method and format that every certified system can process for improved patient care and organizational efficiency.

While both fax and Direct push information from one location to another, the DirectTrust™ network provides efficient, nationwide health data interoperability with **Direct**—encrypted, email-like messages with attachments, designed for HIPAA compliance. With over 2 billion messages exchanged, Direct is a viable and established **alternative to fax**.

The Direct payload—most commonly a C-CDA—can originate from or be ingested into certified EHRs. Refer to product documentation for specifics about user interface and support for payloads beyond those required for certification and access to the nationwide directory.

All network service providers complete technical- and security-related accreditation programs, increasing confidence in these exchanges.

CONTACT SUPPORT

Your MDVita contact can help with setting up or accessing your Direct service and answering questions about applicable incentive program timelines and address publication requirements. Reach out to MDVita as a starting point.
